# Overall project concept

# Emission data and sectoral information

## Refinery & Petrochemistry

1 million tonne  
of crude oil

CO<sub>2</sub> 0,1 – 0,4 million t

VOC	50 – 1000 t
SO <sub>2</sub>	30 - 1500 t
NO <sub>x</sub>	60 - 500 t
CO	20 - 400 t
PM	4 – 75 t
BTX	1 - 70 t

Benzene	5 – 8000 kg
Lead	1 – 1000 kg
Nickel	3 – 1300 kg
Vanadium	1 – 1000 kg

Refineries have multiple sources of CO<sub>2</sub> and other air pollutants, but emissions are mainly connected with **energy production** needed for different refining processes. In general, **heaters, furnaces, gas turbines** etc. are responsible for ca. **60%** of the emissions.

**Main sources of CO<sub>2</sub> emissions  
in refineries:**  
*(depend on complexity of production plant)*

crude  
distillation  
unit (CDU)

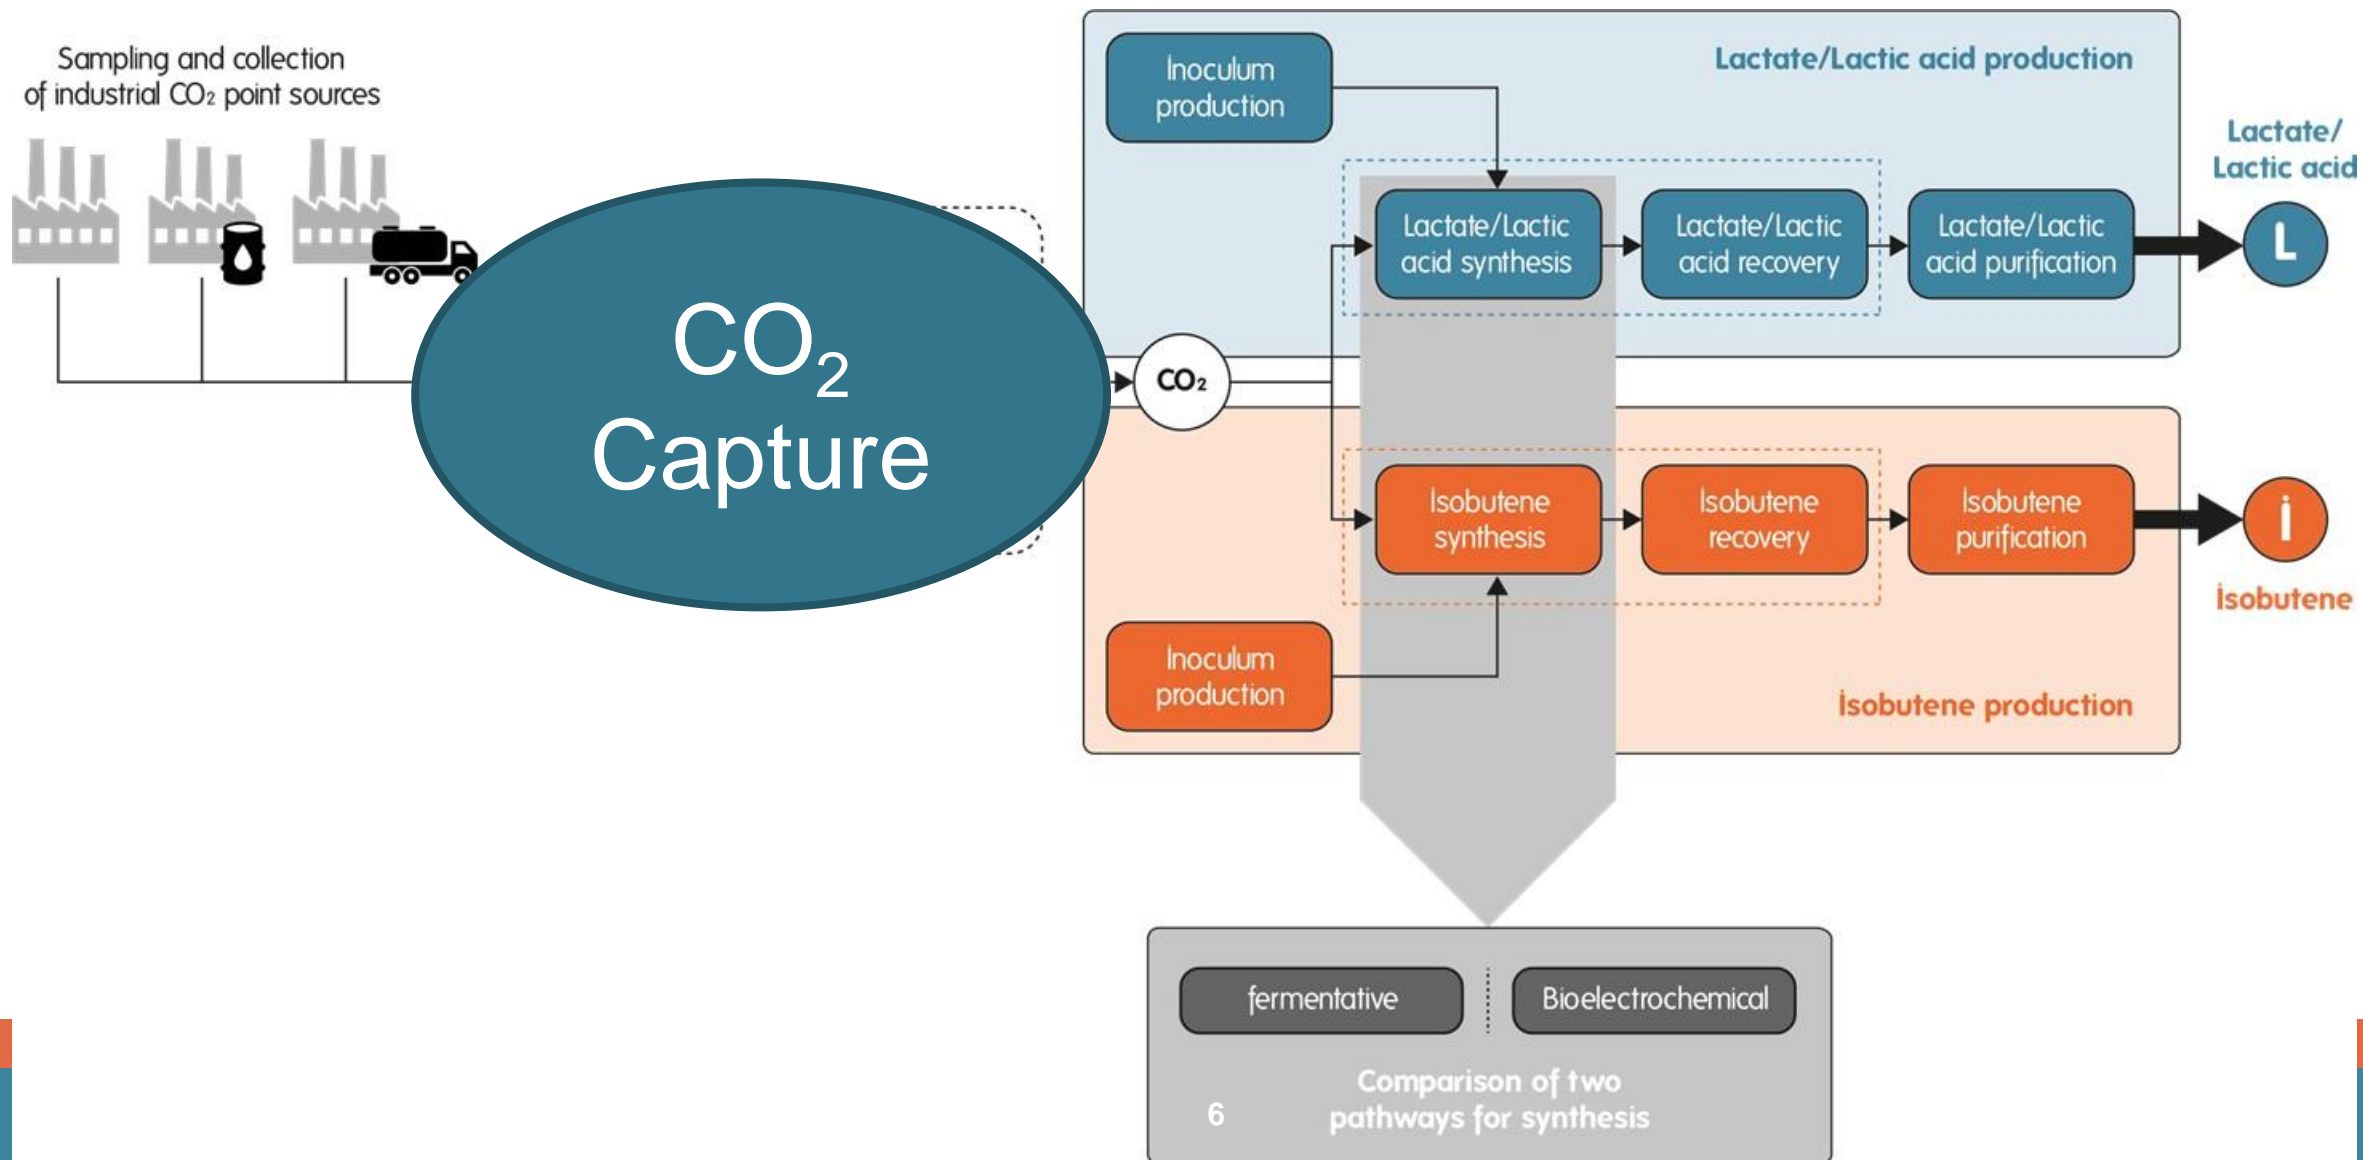

hydrogen  
production  
unit

fluid  
catalytic  
cracking  
(FCC)

*Amount of main air pollutants from 1 million tonne of treated crude oil*

Best Available Techniques (BAT) Reference Document for the Refining of Mineral Oil and Gas.

# Overall project concept

# CO<sub>2</sub> capture: novel hybrid chemo-enzymatic process

MEA: Monoethanolamine

# Enzyme improvement by directed evolution

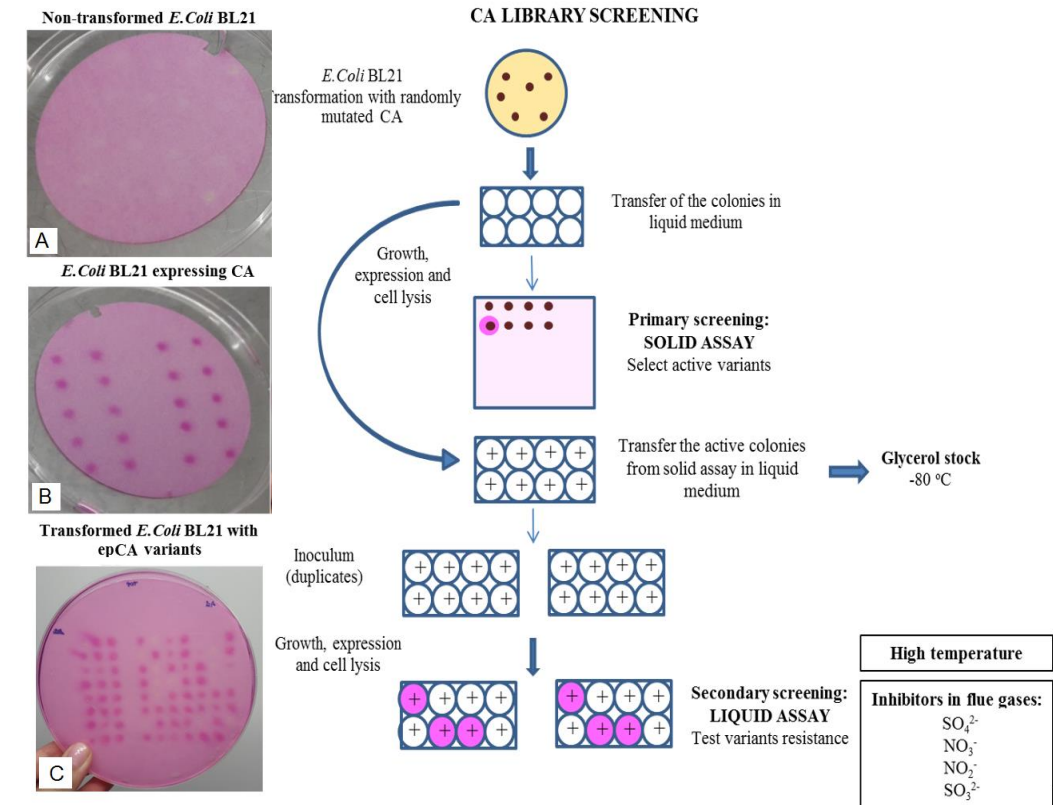

Library construction

Library screening

Scaled-up production of most promising variants

Sequencing for identification of mutations

- 3 mutants showed 50% increased resistance to flue gas inhibitors

# Novel hybrid solvent with competitive absorption and desorption properties

Screening of different AAIL:tertiary amine blends resulted in selection of solvent with

- 5-fold higher initial absorption rate
- 2-fold higher CO<sub>2</sub> load compared to MDEA
- 2-fold higher regeneration at 80°C
- >15% reduction in desorption T compared to MEA

MDEA: Methyl diethanolamine; MEA: Monoethanolamine

# CO<sub>2</sub> capture and pretreatment

## Highlights

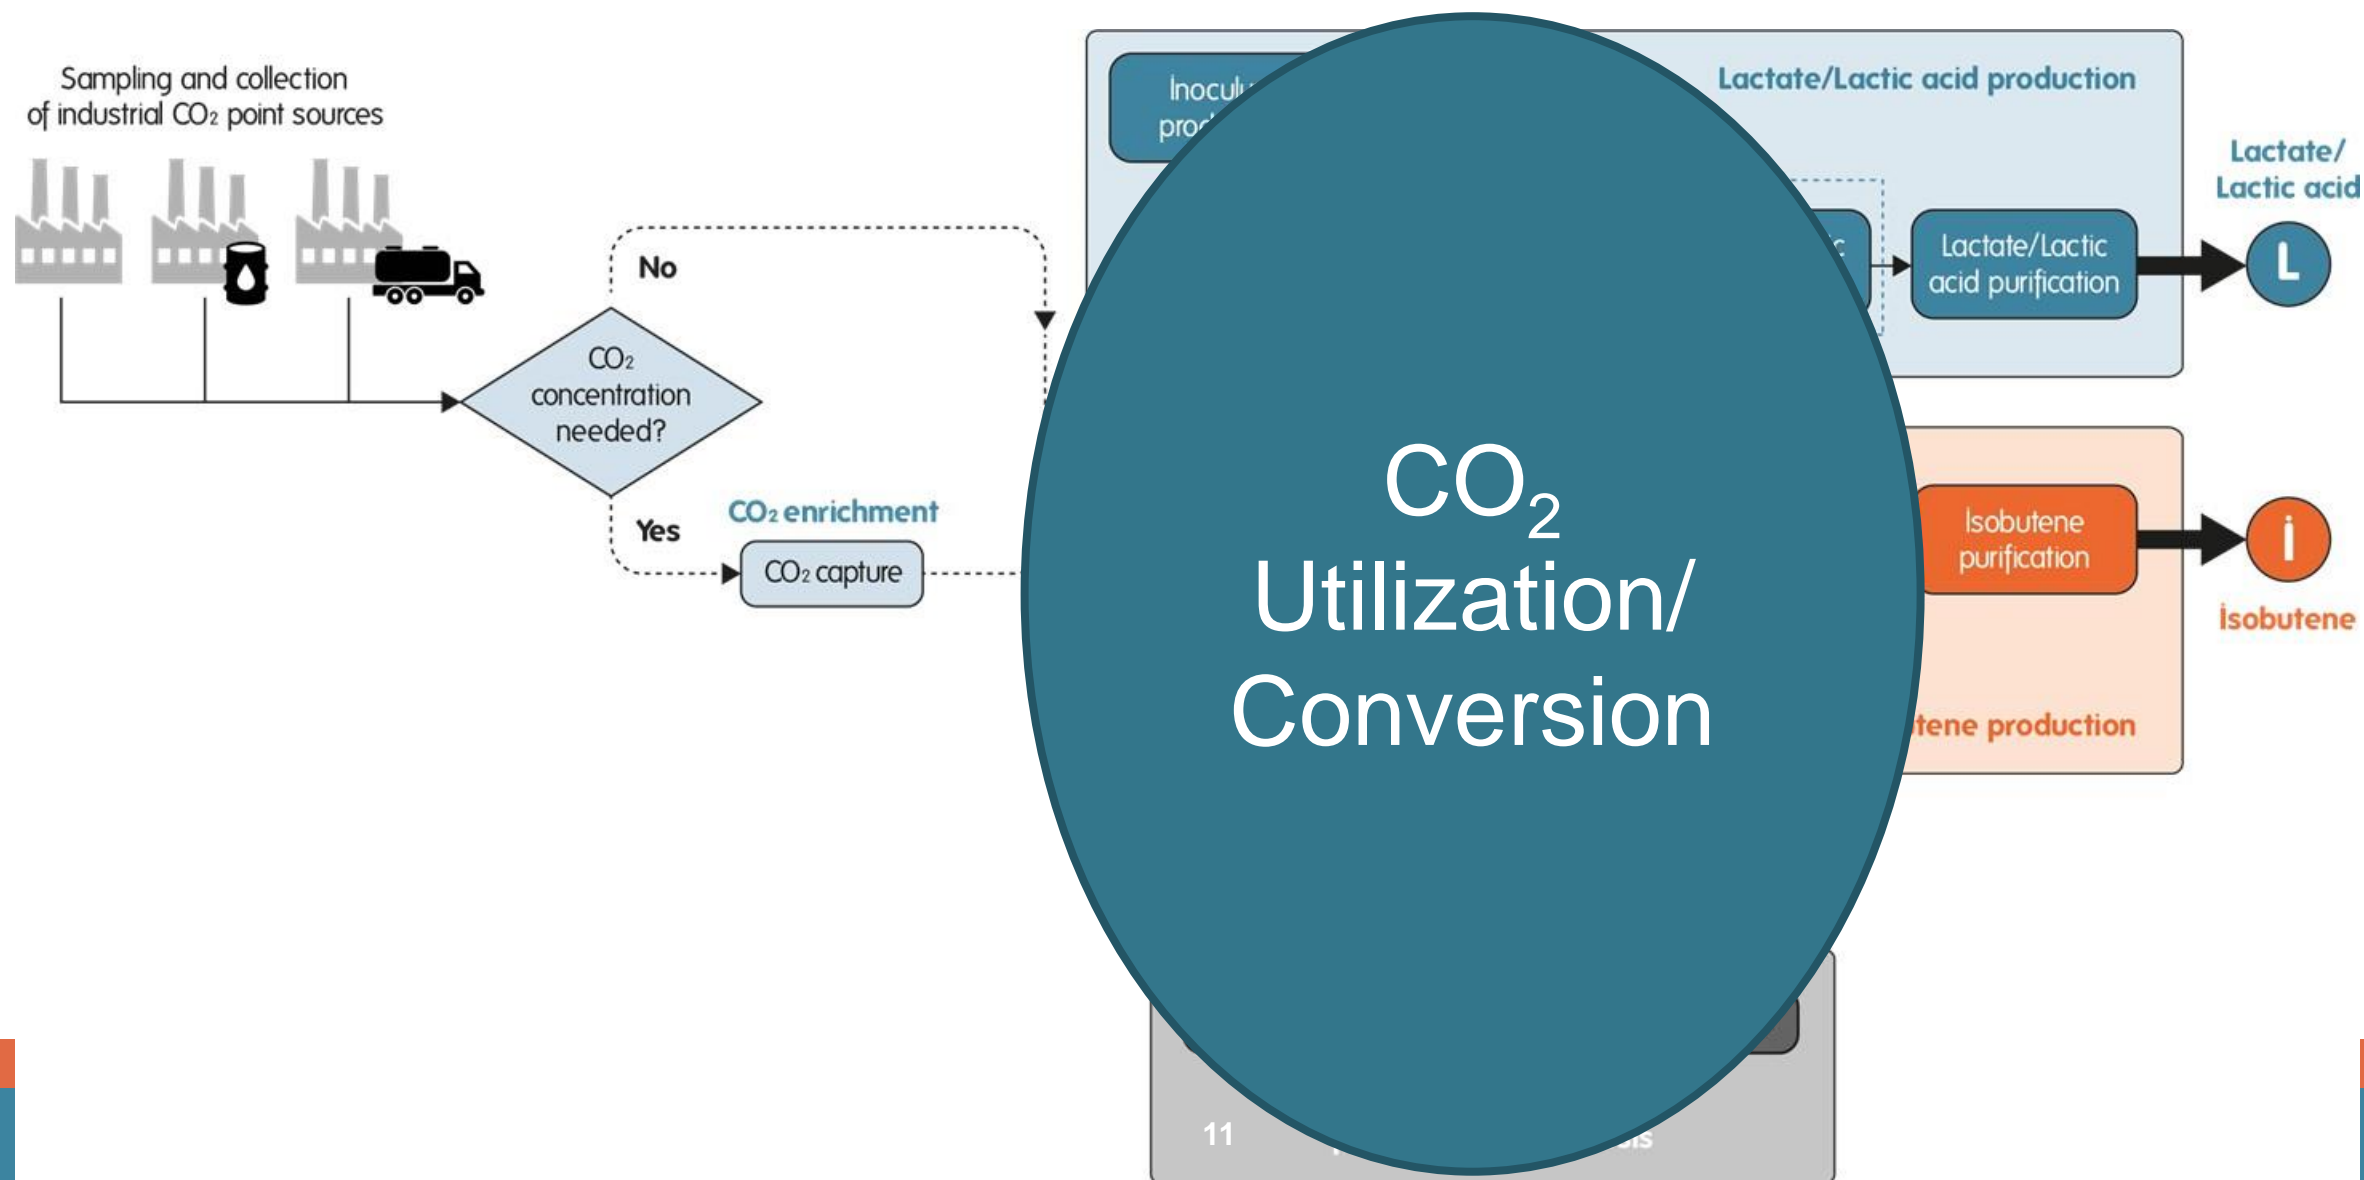

- An ultrastable Carbonic Anhydrase enzyme was improved by protein engineering (and immobilization) for increasing stability towards harsh and high temperature environment
- An enzyme compatible novel hybrid solvent (PEHAp-MDEA) was developed with competitive absorption and desorption properties
- Large-scale Carbonic Anhydrase-aided CO<sub>2</sub> absorption was demonstrated

A) CHE626 Automated Absorption and Stripping Pilot Plant and B) CH906 Hot Water Generator (HFT Global Ltd, Derbyshire, UK) at LTU.

MDEA: Methyl diethanolamine; PEHAp: pentaethylenehexamine proline; MEA: Monoethanolamine

# Overall project concept

# CO<sub>2</sub> conversion: 3 microbial platforms

Microbial platforms		T range	O <sub>2</sub> tolerance	Target product	Partner
Autotrophic	Clostridial strain	Mesophilic	Anaerobic	Isobutene	
	<i>Cupriavidus necator</i>	Mesophilic	Aerobic	Lactate	
Capnophilic	<i>Thermotoga neapolitana</i>	Hyper-thermophilic	Strictly anaerobic	Lactate + H <sub>2</sub>	

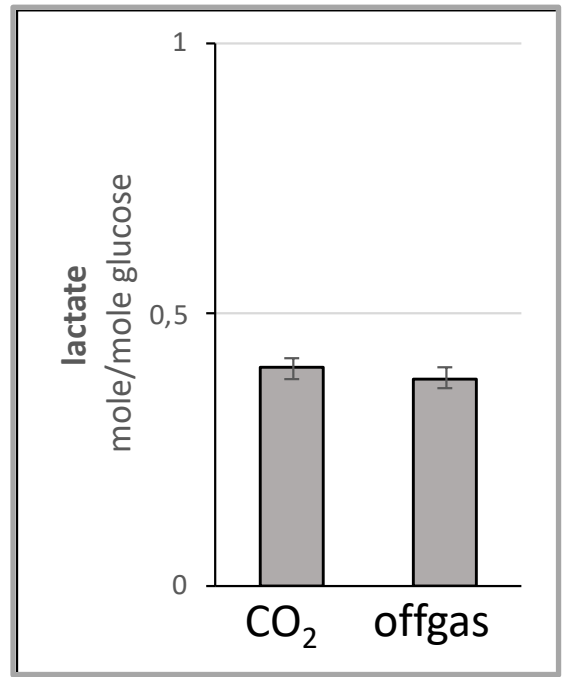

# CO<sub>2</sub> conversion: 3 microbial platforms

## Highlights

- Established manipulation and genetic toolbox for *C. ljungdahlii* and implemented the isobutene pathway
- Isobutene production under autotrophic conditions
- Lactate re-consumption issue solved within *Cupriavidus* and lactate production improved by lactate dehydrogenase overexpression
- Selection of two model strains of *Thermotoga neapolitana*, DSM33003 and RQ7
  - Productivity (increase lactic acid molarity)
  - Genetic tools (transformable strains and amelioration of target steps)

# CO<sub>2</sub> conversion: *Thermotoga* platform

- Tests with real offgas on 1-L scale: same performance as with pure CO<sub>2</sub>

*Thermotoga neapolitana* is tolerant to offgas impurities without pretreatment

# CO<sub>2</sub> conversion: 2 technologies

- 2 technologies

Bio-electrochemical  
systems

[High pressure]  
fermentors

# CO<sub>2</sub> conversion: Bio-electrosynthesis

- Maximize *in situ* H<sub>2</sub> production:  
Abiotic vs. **Biotic** mediated H<sub>2</sub> production

Thermophilic Microbial Electrolysis Cell

- Higher reaction rates
- Less risk of contamination
- More product specificity
- Heat management

## Green Chemistry

### Thermophilic bio-electro CO<sub>2</sub> recycling into organic compounds†

Laura Rovira-Alsina, <sup>a</sup> Elisabet Perona-Vico, <sup>b</sup> Lluís Bañeras, <sup>b</sup> Jesús Colprim, <sup>a</sup> M. Dolors Balaguer <sup>a</sup> and Sebastià Puig <sup>a</sup>

# CO<sub>2</sub> conversion: Bio-electrosynthesis

Set-up of mild thermophilic systems

## Chronology

Reactors 1 and 2 (280 d operation)

After 70 d, inoculation of

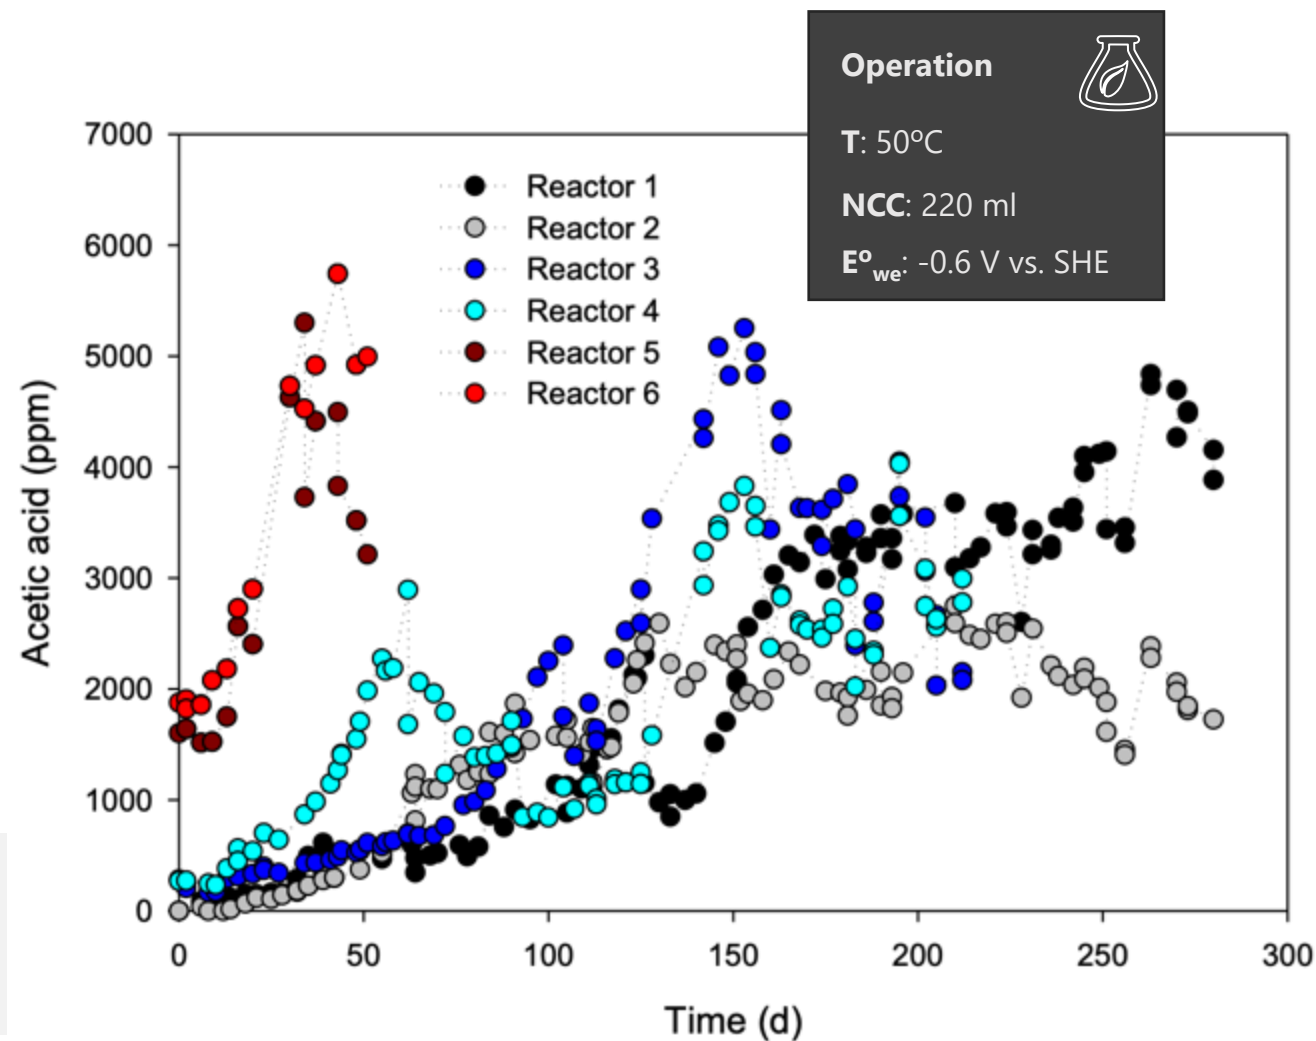

Reactors 3 and 4 (210 d operation)

After 160 d, inoculation of

Reactors 5 and 6 (50 d operation)

- Max production rate: 28 g acetate m<sup>-2</sup> d<sup>-1</sup>
- Coulombic efficiency: 80-90%

# ynthesis

# Gas (CO<sub>2</sub>, H<sub>2</sub>) solubility is low

- Gas-liquid mass transfer rate 
$$\frac{dC_{i,L}}{dt} = K_L a_i * (y_i * P_R * H_i - C_{i,L})$$
  - $K_L$ : overall mass transfer coefficient (based on liquid concentrations)
  - $a$ : interfacial area between gas and liquid
  - $K_L a$ : volumetric gas-to-liquid mass transfer coefficient
  - $P_R$ : (absolute) reactor pressure
  - $y_i$ : mole fraction of compound i in gas phase and
  - $C_{i,L}$ : dissolved gas concentration of compound i
  - $H_i$ : Henry's law coefficient for component i
- Can be improved by increase in pressure

Source: Van Hecke et al. (2019)

# CO<sub>2</sub> conversion: Pressurized fermentations (5-10 bar)

## Effects on microbial growth and product formation

- **Variable threshold** (either total pressure or partial pressure of specific substrate) above which microbial growth and metabolism is affected
- **Inhibitory effects** of increased partial pressure H<sub>2</sub> or of increased dissolved CO<sub>2</sub>

## Process operation and control

- Feedback control of **dissolved gas concentration** needed for reactor stability
- Process monitoring and determination of kinetic parameters complicated by **lack of dissolved gas sensors** (except for O<sub>2</sub>) resistant to and accurate at broad P ranges
- Fermentations at moderately elevated pressures using C1 gases **underexplored**

Source: Van Hecke et al. (2019)

Fermentor skid

Online GC

# Pressurized fermentor: main features

- In situ sterilizable bioreactor for gaseous fermentations
- CO<sub>2</sub>, H<sub>2</sub>, CO, O<sub>2</sub>, N<sub>2</sub>, gas mixtures such as syngas or real offgases
- Operation at constant or variable pressures up to 10 bara
- Food grade + ATEX (  $\text{Ex}$  II 2G) gas fermentation
- Online process monitoring and control
- Online gas analysis and control
- Integrated membrane filtration

# Some experimental results

- Study effect of increasing pressure
- Compare at constant CO<sub>2</sub> partial pressure

Pressure	Headspace H <sub>2</sub> /CO <sub>2</sub> (vol%)	Main product (g/L)*	Productivity (g/L.h)
3 bar	80/20	25 (↑)	0,19
6 bar	88,5/11,5	21	0,21
9 bar	92/8	18 (↑)	0,17

*\*at same fermentation duration*

- H<sub>2</sub> transfer not main limiting factor
- Limited inhibitory effect of increasing pressure or H<sub>2</sub> partial pressure
- No changes product spectrum

# Need for high product titers

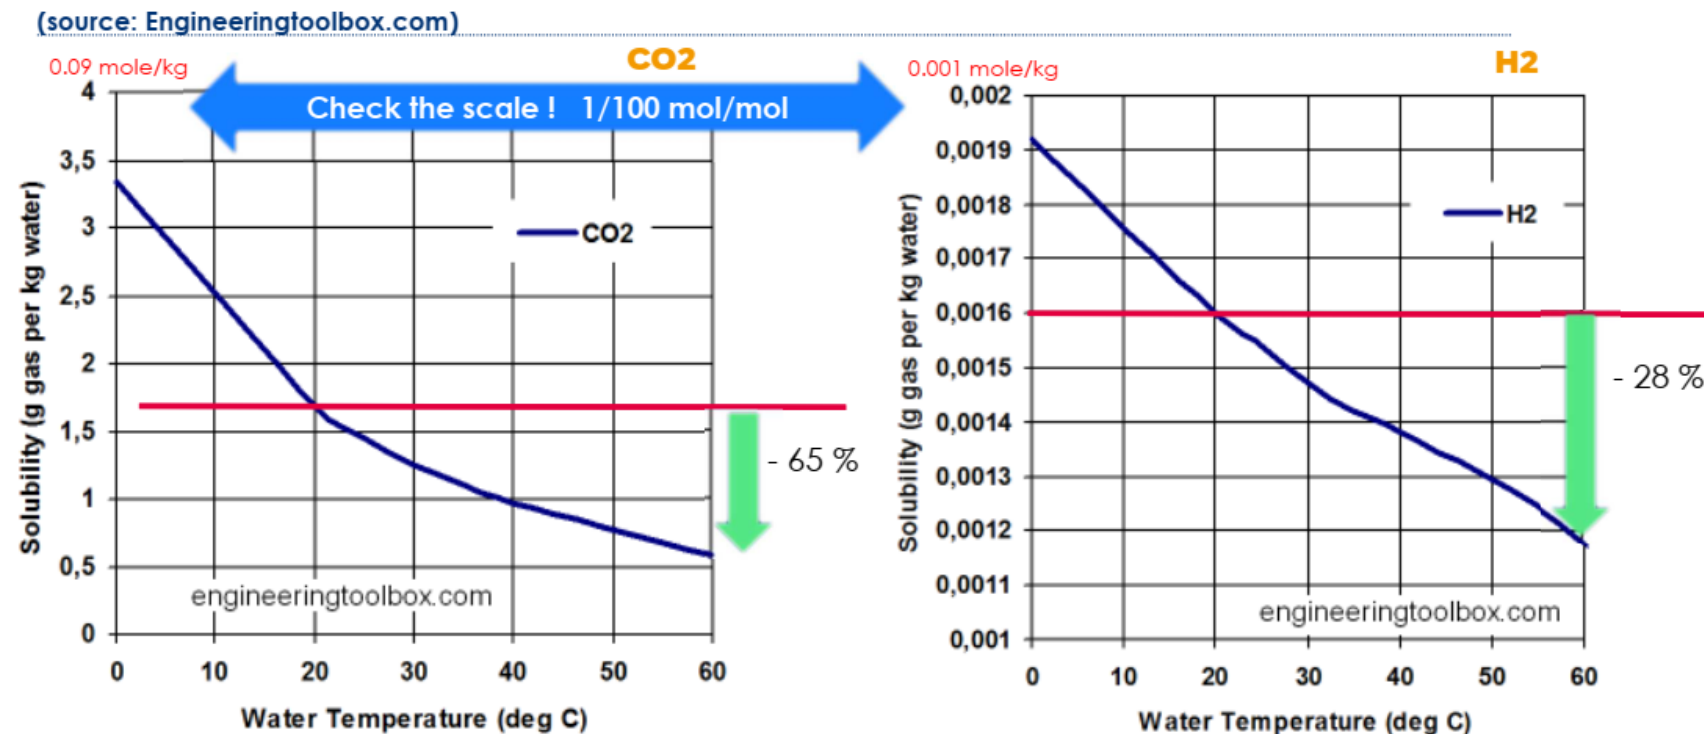

- Titer >10-20 g/L: need for cooling
- Heat losses not detectable at lab-scale, but substantial at industrial scale

- 100 kton lactic acid/yr
  - ≈ energy loss of 93 900 MWh/yr
  - ≈ energy consumption > 14 000 Europeans

# (High) product titers from CO<sub>2</sub> + H<sub>2</sub>

- Lot of heat produced at low temperature: Use for district heating? In greenhouses?
- Operation at higher T preferable for heat valorization  
→ (hyper)thermophilic range
- Issue gas solubility

# Use of alternative reducing agents?

	Reaction	$\Delta_r H^\circ$ (kJ/mol)
$H_2 + CO_2$	$3 CO_2 + 6 H_2 \rightarrow C_3H_6O_3 + 3 H_2O$	-298
Methanol + $CO_2$	$2 CH_4O + CO_2 \rightarrow C_3H_6O_3 + H_2O$	-36
Ethanol + $CO_2$	$C_2H_6O + CO_2 \rightarrow C_3H_6O_3$	50

# CO<sub>2</sub> conversion technologies

## Highlights

- Flexible prototypes available as high tech research platforms
- Pressurized fermentor to study impact (partial) pressure on processes and optimize them prior to scale-up
- CO<sub>2</sub> conversion tested at pressures up to 10 bara and with real CO<sub>2</sub>-rich offgases
- Challenging to have high product titers from CO<sub>2</sub>/H<sub>2</sub> and good heat management

# Modelling and simulation

- **Mathematical modelling**
  - Development tool

- Modular models (overall solutions)
- Specialized solvers are available
- Feasible connection with python (for optimization & data recovery)
- **Open source**

# Modelling and simulation

- **Mathematical modelling**

- Process → 5 overall models

# Modelling and simulation

## Advances beyond State of the Art

- Thermodynamics for novel tailored made solvents for CO<sub>2</sub> capture process
- Comprehensive modelling of bio-electrochemical & biological systems considering
  - Physical chemistry (mass transfer & equilibrium)
  - Microbiology (growth and production)
  - Electrochemistry (H<sub>2</sub> production by water electrolysis)
  - Bio-electrochemistry (H<sub>2</sub> production using biocathodes)
- Simulation/optimization tool (open-source environment: OpenModelica & Python)
  - Allowed to simulate hypothetical scenarios, showing the way for upscaling the project technology

# Social acceptance of CCU

## We wanted to look at two perspectives

- Industry
  - CCU industry about social acceptance by consumers regarding converted CO<sub>2</sub> in products
  - Companies that already have CO<sub>2</sub>-based products on market about acceptance issues
- Consumers
  - How consumers feel about issue on converted CO<sub>2</sub> in their products
  - Which factors play a major role for acceptance

## Methodology

- Literature research on consumer perception
- Online survey with 11 questions (n=93) circulated via our industry networks
- 4 expert interviews with companies who already launched CCU products
- 4 focus group discussions with 4-6 consumers each

# Social acceptance of CCU

- Few studies have investigated the social acceptance of captured CO<sub>2</sub> in consumer products.
- Little is known about CCU as a technology among the wider population
  - Found positive correlations for people:
    - with regard to the attitude “environmental awareness”
    - with regard to a more technical background
    - with regard to the age of people (higher awareness when younger)
- Acceptance and trust in novel technologies like CCU are strongly dependent on the source of knowledge (knowledge provider)
  - → e.g. in Germany, the government and NGOs are considered trustworthy
- Difference between general agreement with a technology and having to interact personally → NIMBY effect (not-in-my-backyard effect)

# Social acceptance of CCU

## Main take-aways companies

- Difficult to market the concept of CCU
- Similar to bio-based, maybe use simpler terminology to get the message across
- Currently, brands are a stronger driver than regulation & policy for CCU
- Companies are largely convinced that a reliable label would be a strong tool for marketing

## Main take-aways consumers

- No knowledge of CCU - positively surprised about CCU when they understand the concept
- Trust is strongly dependent on the source of information
- Issues can arise via the NIMBY-effect: If people perceive issue to personal health or other personal limitations (e.g. CCU plant in neighbourhood), they might oppose
- Best method to transfer information likely depends on the circumstances

## Webinar: Value from CO<sub>2</sub>: The Power of Biotechnology

Zoom Webinar

BioRECO<sub>2</sub>VER

### Value from CO<sub>2</sub>: The Power of Biotechnology

23 Nov 2021 | 14:00 – 17:00 CET

Carbon is the main component of hundreds of materials used in industrial processes and in our daily lives. To meet the increasing demand for these products in a sustainable way, various types of renewable carbon can be used, including CO<sub>2</sub>. Industrial biotechnology has a high potential to tackle harmful CO<sub>2</sub> emissions and convert CO<sub>2</sub> into value-added products, but there are still some technical and economic barriers to address. The multidisciplinary webinar offers a variety of perspectives on this relevant topic.
